

PROLONGED PRESERVATION OF HUMAN LIVER USING NORMOTHERMIC MACHINE PERFUSION PROCESS

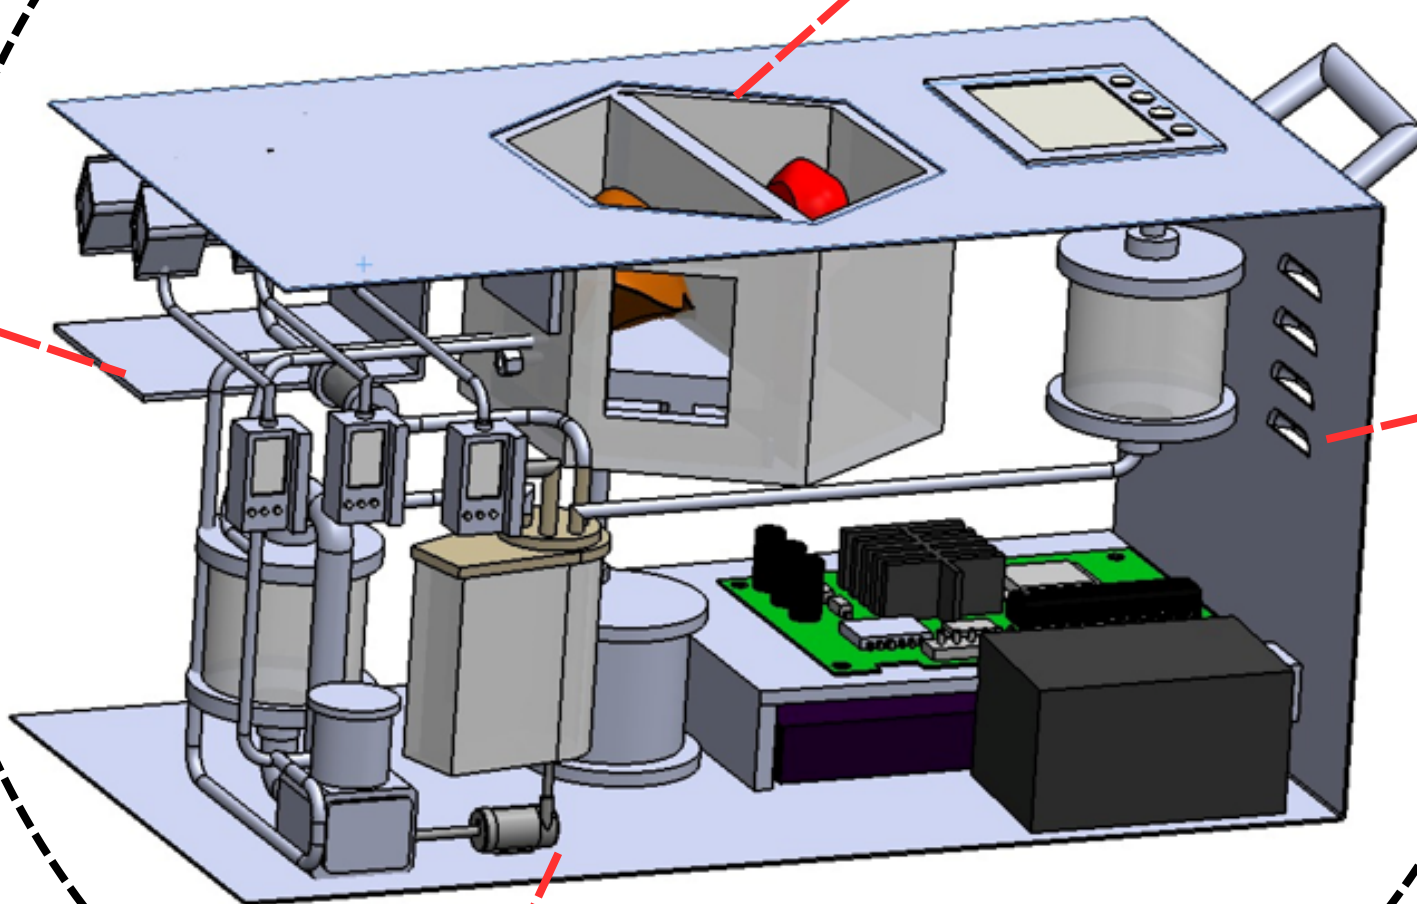

The preservation time for the organ is significantly prolonged, offering up to 12 hours of viability, compared to traditional methods.

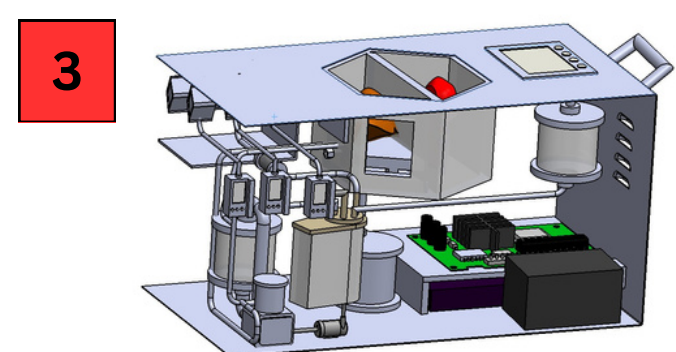

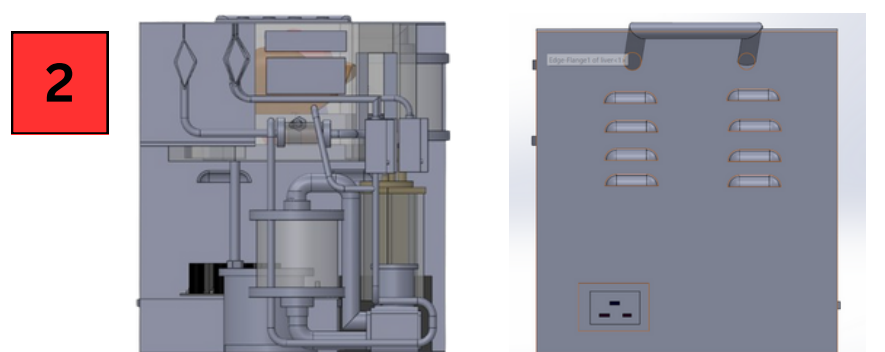

Prototype Overview

Work Flow

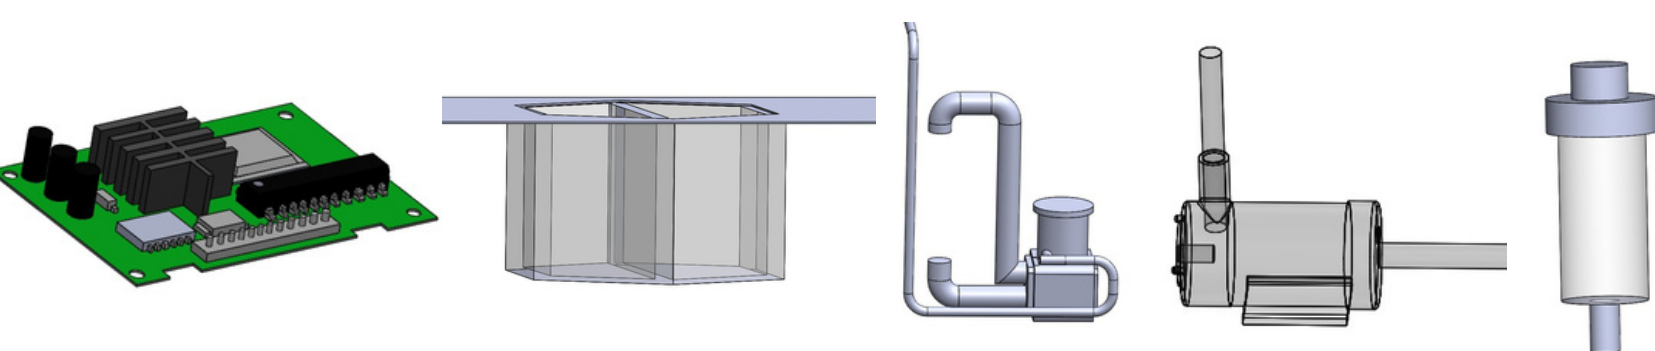

Design Process

Key Features

- PNMP preserves and assesses discarded human livers for transplantation.
- Cold storage methods have limitations, leading to the discard of viable organs.
- PNMP involves continuous oxygenated perfusion at normal body temperature.

Components

Novel Idea:

- ATP Analysis
- HPE Examination
- Cytokine Filter
