Abstract

Our project introduces an advanced short circuit prevention mechanism for electric vehicles, focusing on improving safety, reliability, and performance. Traditional protection methods like fuses and circuit breakers are reactive and insufficient for modern EVs. Our system uses machine learning algorithms, and intelligent control for high-speed monitoring to proactively detect and prevent faults

Introduction

- ❑ Growing Global EV Adoption As electric vehicles (EVs) continue to grow in popularity, ensuring the safety of users has become increasingly important.
- ❑ Safety Concern Short circuits in EVs can lead to system failures, component damage, and pose significant safety risks to users.
- ❑ Current Protection Limitations Traditional methods like fuses and circuit breakers are slow and reactive, which leaves EVs vulnerable to short circuits.
- ❑ Our Solution present a proactive short circuit prevention system that utilizes high-speed monitoring, machine learning, and intelligent control to detect and prevent faults in real-time.

Literature Review Table

Author	Title	Year of published	Remarks
H.-C. Park et al.	"Design and Evaluation of High-Speed Overcurrent and Short-Circuit Detection Circuits With High Noise Margin for WBG Power Semiconductor Devices"	2024, IEEE Access	Focuses on device-level protection circuits lacks application to large-scale EV systems or grid-connected setups.
D. Walch et al.	"Inter-Turn Short Circuit Faults and Mitigation Measures for Dual-Three Phase Machines"	2024, ICEM Conference	Limited to specific machine configurations applicability to other motor types or EV systems not explored.
I. Husain et al.	"Electric Drive Technology Trends, Challenges, and Opportunities for Future Electric Vehicles"	2021, Proceedings of the IEEE	Broad overview of trends does not provide deep technical insight into fault detection or mitigation strategies.

Literature Review Table

Author	Title	Year of published	Remarks
D. Qiao et al	"Quantitative Diagnosis of Internal Short Circuit for Lithium-Ion Batteries Using Relaxation Voltage"	2024, IEEE Transactions on Industrial Electronics	Focuses primarily on diagnosis without providing real-time mitigation strategies for detected faults.
Z. Sun et al.	"An Online Data-Driven Fault Diagnosis and Thermal Runaway Early Warning for Electric Vehicle Batteries"	2022, IEEE Transactions on Power Electronics	Limited to battery systems; lacks consideration of external factors like environmental conditions.

Block Diagram of Existing System

Existing System

- ❑ Existing system uses a basic power supply that sends electricity directly to the vehicle without checking for problems.
- ❑ Fuses and circuit breakers are used to stop power only after a short circuit happens.
- ❑ These safety parts work slowly and only react after damage may have already started.
- ❑ There is no smart control or real-time monitoring, which means the system cannot prevent faults early.

Problem Statement

- ❑ Electric vehicles are prone to short circuits due to cell imbalance, overcurrent, insulation failure, and thermal runaway.
- ❑ These faults can cause severe safety risks, system failures, and damage to components.
- ❑ Conventional methods like fuses and breakers react slowly and lack real-time fault detection.
- ❑ A smart, high-speed system is needed to pro actively detect and prevent short circuits in Evs.

Objective

Our project aims to develop a proactive safety system for electric vehicles (EVs) that detects and prevents short circuits using machine learning and high-speed monitoring. It focuses on addressing key issues such as cell imbalance, overcurrent, insulation failure, and thermal runaway. The goal is to enhance system performance and user safety while promoting sustainable EV adoption through advanced fault prevention. The system will replace conventional reactive methods with intelligent, adaptive control solutions tailored for modern EV platforms.

Proposed Methodology

Working of Proposed System

- ☐ Sensors monitor real-time voltage, current, temperature, and cell imbalance, sending data to a PIC microcontroller for local processing.
- ☐ The data is simultaneously updated to the cloud for remote monitoring and further analysis.
- ☐ An LSTM-based machine learning model runs on edge/cloud to predict short circuit risks and trigger a relay-based cut-off if needed.
- ☐ An efficient cooling system using liquid cooling with phase-change material (PCM) or active air-cooled fins maintains optimal battery temperature during high-load conditions.

Advantages

- ☐ Early Detection of Short Circuits
- ☐ Detects Cell Imbalance Accurately
- ☐ Automated circuit Isolation avoid damage
- ☐ Cloud storage enables remote monitoring

Application

- ☐ Predictive Maintenance Platform
- ☐ Battery Safety Solutions
- ☐ Cloud Based Monitoring Systems
- ☐ Autonomous and Connected Vehicles
- ☐ Battery Energy Storage System

Results and Discussion

(a) Monitoring of Battery Temperature

(b) Monitoring Constant Voltage and Current

(c) Over charge Alert

(d) State of Charge Tracking

Conclusion

Our project presents an intelligent and proactive safety mechanism for electrical systems, utilizing AI-based predictive analytics and real-time monitoring to detect and prevent short circuits effectively. By addressing key issues like cell imbalance, overcurrent, and thermal risks, the system ensures enhanced safety, reliability, and efficiency. With automated control and cloud-based data handling, this solution marks a significant step towards smarter and safer energy systems, supporting the future of sustainable electric mobility.

Abstract:

In order to improve safety, dependability, and system performance, the proposed project introduces a cuttingedge short circuit preventative mechanism made especially for electric vehicles (EVs). In EV power systems, short circuits are a serious problem since they can result in serious harm, component failures, and safety risks. Traditional protection techniques, including circuit breakers and fuses, are frequently slow,
