(57) Abstract :

ABSTRACT A SYSTEM FOR ORGAN STORAGE AND A METHOD THEREOF The present invention discloses a system for organ storage (20) and a method thereof to preserve the discarded human organ for transplantation. The system (20) for organ storage comprises a power source, an organ basin and a cleanser unit. The cleanser unit (3) removes the bacteria and unwanted particles from the organ basin for maintaining the health of organ. The power management system (16) is configured to manage and supply the necessary amount of power to the organ storage device. The cytokine filter (12) removes the excessive cytokines from the medicinal fluid by passing the fluids through the filter. The analysis module (7) is configured to analyze the energy status and viability of the organs during the storage. The evaluation module (10) examines the organ tissues by assessing their structure, morphology and pathological changes for checking the suitability for transplantation. The display (2) shows the one or more essential parameters necessary for preserving the organ. The organ storage system (20) will reduce the failure due to damages while preserving the organ in the transplantation. FIG 1

(57) Abstract :

ABSTRACT SYSTEM AND METHOD FOR WIRELESS POWER TRANSFER IN ELECTRIC VEHICLE CHARGING STATION USING METAMATERIAL The present invention discloses a system and method for wireless power transfer in electric vehicle charging stations using metamaterial. The system (15) comprises a camera, solar panels, IR sensor, conveyor line, metamaterial layer and microcontroller. The plurality of solar panels (1) operatively coupled at the top of horizontal columns for generating the electricity. The camera (11) is configured to detect the type of moving vehicle in the charging station. The IR sensor (5) is configured to detect and maintain the distance between the primary coil and the top base of vehicle. The conveyor line (3) operatively connected by a motor for moving the hydraulic cylinder, IR sensor and primary coil in the speed of charging vehicle to enable the power transfer in vehicle moving condition. The frequency selective surface (10) is configured to reduce the electromagnetic interferences from the electric vehicle during the wireless power transfer. The receipt generation module (12) is configured to generate the bills by calculating the utilized energy while charging of vehicle in moving condition. The power transfer system (15) will reduce the time and losses while charging of electric vehicles in moving condition. FIG 1
